CLIVORA

Status · What's Done · Docs (Nextra) Ideas · Next Solutions — v2.15.0 · 11 Jul 2026

1. Executive summary

CLIVORA v2.15 ships invoice reminders (daily cron), promo/referral checkout, Connect proposal→milestone kickoff, live Hub KPIs, Android Connect sort + conflict dialogs, and Stripe Customer Portal stubs. Trust/reviews/escrow ledger from v2.14 remain in place. Builds are on GitHub release **v2.15.0-playstore**; web is live on clivora.codcrafters.org.

2. Download links (GitHub release)

3. What's done (shipped)

v2.14 — Trust & Connect foundation

- Connect reviews, proposals, milestones, escrow ledger + admin release
- Talent-card ratings (avg_rating, review_count), New badge, reputation sort + triggers
- Profile completeness; Flutter inbox leave-review; Hub trust shortcuts
- Play payments account docs (merchant IDs stay in Play Console — not in app code)

v2.15 — Growth, ops & UX gaps

- Edge Function send-invoice-reminders (Resend, idempotent +3 day cadence, batch 40)
- pg_cron job clivora-invoice-reminders-daily at 08:00 UTC — smoke HTTP 200
- Promo CLIVORA15 active (15% off, max 50 uses); promo field on Pro checkout
- Web /app/referrals referral UI
- Proposal accept → automatic kickoff milestone (web + Flutter)
- Live Hub KPIs (hub-kpis.ts)
- Android Connect sort picker; project/customer sync conflict dialogs
- Stripe Customer Portal API stub + ManageBillingButton (needs STRIPE_* secrets)
- Vercel production build fixed (promoMeta null) — READY on clivora.codcrafters.org
- App version: Flutter 2.15.0+72 · Web 2.15.0

Architecture locked (do not re-litigate)

- Supabase = cloud source of truth; Flutter SQLite = offline + outbox
- Payments: JazzCash/manual on web; Play Billing on Android → profiles.subscription_plan
- Connect: Pro Plus to post/contact; browse can stay free
- Do not vendor Keycloak / Rocket.Chat / Discourse / Twenty / Kill Bill — patterns only

4. Docs today vs Nextra improvements

Today CLIVORA uses a **custom Next.js docs shell** (Markdown in web/content/docs, react-markdown, DocsShell) — not Nextra yet. That is fine for a small catalog (8 pages). Below: what to improve either by staying custom or adopting Nextra.

A. Improve current docs (low cost — recommended first)

- Add search (FlexSearch or Pagefind) over content/docs — biggest UX win
- Auto-generate sidebar from frontmatter (title, order, section) instead of hard-coded DOC_CATALOG
- Split docs into sections: Getting started · Billing · Connect · Mobile · FAQ
- Keep changelog.md in sync with release tags; link APK/AAB from changelog
- Add copy-code buttons, TOC on long pages, prev/next footer
- i18n stubs later (Urdu/English) only if demand is clear
- Publish printable PDF via existing docs:pdf script — wire into CI

B. Adopt Nextra 4 (when docs grow past ~20–30 pages)

- Nextra gives file-based routing, _meta.js sidebar, built-in search, dark mode, MDX components
- Best fit: keep marketing site on App Router; mount Nextra under /docs or a docs-only package
- Pros: less custom DocsShell maintenance; better MDX (callouts, tabs, file trees)
- Cons: dependency churn with Next 15; another theme to brand; risk of fighting App Router layout
- Lighter alternatives: Fumadocs (App Router native) or Mintlify (hosted) for zero infra
- Recommendation: stay custom + add search now; revisit Nextra/Fumadocs when Connect + API docs expand

C. Content to add next (regardless of engine)

- Play Billing / restore purchases troubleshooting
- Connect: proposals, milestones, reviews, escrow status for freelancers vs clients
- Invoice reminders: what customers receive and how to mark paid
- Promo & referral: CLIVORA15 + sharing referrals
- Keep privacy / data-safety discoverable from docs index

5. Other solutions & features worth including

P0 — finish ops (no new platforms)

- Google OAuth consent screen: App name = CLIVORA
- Confirm RESEND_* on Edge Functions; E2E test one overdue invoice reminder email
- Vercel: SUPABASE_SERVICE_ROLE_KEY (and optional STRIPE_* only if card checkout needed)
- Play Console: 4 SKUs Active + upload AAB to testing track

P1 — product (high leverage, stay in-stack)

- Client needs-action dashboard (overdue invoices, pending proposals, disputed milestones)
- Connect portfolio gallery + saved searches with email alerts
- Recurring invoices on web; dispute ↔ support tickets bridge
- Real RAG embed-on-write for Ask AI (when LLM budget is approved)
- Meilisearch only if Connect catalog search feels slow — helper already exists

P2 — optional external patterns (borrow, don't host)

Area	Borrow from	CLIVORA approach
CRM UX	Twenty CRM	Keep custom Hub; copy list/detail patterns
Invoicing	SolidInvoice / Invoice Ninja	Status workflows + PDF; not a full fork
Search	Meilisearch	Optional service when volume grows
Automations	n8n patterns	Supabase cron + Edge Functions

AI / RAG	LangChain patterns	crm_embeddings + Edge Function
Docs	Nextra / Fumadocs	Custom now → migrate if docs explode
Support	Chatwoot patterns	Keep /support + tickets; widget later
Auth	—	Stay on Supabase Auth; no Keycloak

Defer / avoid for cost & focus

• Full Stripe Connect escrow funding until compliance + keys are ready (ledger UI is enough)
• iOS App Store until Android Play track is stable
• Hosting Discourse / Rocket.Chat / Keycloak / Kill Bill

6. Manual checklist for you

■ Upload AAB from release to Play internal/closed testing
■ Paste any missing Vercel secrets (service role / Stripe)
■ Publish Google OAuth branding
■ Send yourself a test overdue invoice to verify reminder email
